Abstract

In recent years, thermal decomposition studies of transition metal complexes with benzenopolycarboxylate ligands have become an area of a great importance due to the possibility of obtaining useful metal oxides with desirable electrical, magnetic and catalytic properties [1]. As a contrast to conventional methods for the preparation of metal oxides, such as hydrothermal or sol-gel treatment, thermolysis is faster, more efficient and environmentally friendly. Mn(II)-dipyra (dipyra = 2,2'-dipyridylamine) complex with tetraanion of 1,2,4,5-benzenetetracarboxylic (pyromellitic, H₄pyr) acid, [Mn₂(dipyra)₂(pyr)(H₂O)₂], has been prepared and characterized by elemental, spectral and microscopy analyses. Direct thermolysis of the complex up to 1200 °C in an air atmosphere yielded spinel Mn₃O₄ oxide material. The obtained Mn₃O₄ has been characterized for its structural, spectroscopic, morphological and optical properties. The possibilities of using this oxide as photocatalyst or co-photocatalyst for removing textile organic dyes, as well as inorganic pigmentary material, were also investigated and discussed.
